2) Fuzzy logic controller process user-defined rules and override the target control system. It can be altered easily to improve or boost system performance. By generating appropriate governing rules, new sensors can be easily generated into the system. 3) Fuzzy logic is not limited to only one or two control outputs or few feedback inputs.

Fuzzy Logic Tutorial: History, Implementation and Advantages

Fuzzy logic is a basic control system that relies on the degrees of state of the input and the output depends on the state of the input and rate of change of this state. In other words, a fuzzy logic system works on the principle of assigning a particular output depending on the probability of the state of the input. How did Fuzzy Logic Originate?

Fuzzy Logics is a logic or control system of an n-valued logic systemwhich uses the degrees of state"degrees of truth"of the inputs and produces outputs which depend on the states of the inputs and rate of change of these states (rather than the usual "true or false" (1 or 0), Low or High Boolean logic (Binary) on which the modern computer is based).

Control Engineering | Temperature control: PID vs. Fuzzy Logic

Fuzzy logic has been applied to various fields, from control theory to AI. It was designed to allow the computer to determine the distinctions among data which is neither true nor false. Something similar to the process of human reasoning. Like Little dark, Some brightness, etc.

Fuzzy Logic Tutorial: What is, Application & Example

Fuzzy logic controllers usually outperform other controllers in complex, nonlinear, or undefined systems for which a good practical knowledge exists. Fuzzy logic controllers are based on fuzzy sets, that is, classes of objects in which the transition from membership to nonmembership is smooth rather than abrupt.

For other uses, see Fuzzy logic (disambiguation). In fuzzy mathematics, fuzzy logic is a form of many-valued logic in which the truth values of variables may be any real number between 0 and 1 both inclusive. It is employed to handle the concept of partial truth, where the truth value may range between completely true and completely false.
