Gravimetric Analysis Lab Calculations

Gravimetric analysis is a quantitative method for accurately determining the amount of a substance by selective precipitation of the substance from an aqueous solution. The precipitate is separated from the remaining aqueous solution by filtration and is then weighed. Assuming that the chemical formula for the precipitate is known and that the precipitation reaction goes all the way to completion, then the mass of the substance in the original sample can be determined.

The principle behind gravimetric analysis is that the mass of an ion in a pure compound can be determined and then used to find the mass percent of the same ion in a known quantity of an impure compound. In order for the analysis to be accurate, certain conditions must be met: The ion being analyzed must be completely precipitated.

Gravimetric Analysis - Wired Chemist

Gravimetric methods are quantitative methods that are based on measuring the mass of a pure compound to which the analyte is chemically related. Since weight can be measured with greater accuracy than almost any other fundamental property, gravimetric analysis is potentially one of the most accurate classes of analytical methods.

Calculate the mass of calcium in grams. $\text{mass (Ca)} = \text{moles} \times \text{molar mass. mass (Ca)} = 0.019 \times 40.08 = 0.76 \text{ g. Calculate the percentage by mass of calcium in the original sample: } \%Ca = \frac{\text{mass Ca}}{\text{mass sample}} \times 100. \%Ca = \frac{0.76}{2.00} \times 100 = 38\%$.
