China's electroplating process is mainly zinc, copper, nickel, chromium plating, with 50% of the zinc painting and 30% of copper, chromium and nickel painting, respectively. If the purpose is to prevent rust, zinc or cadmium plating can be used; if the focus is to prevent wear and tear, nickel or chromium plating is the best choice.

Therefore, chromium to iron becomes a cathodic coating. Application: Direct chromium plating on the surface of steel parts as an anticorrosive layer is not ideal. Generally, multi-layer electroplating (ie copper plating → nickel → chromium) can be used to achieve the purpose of antirust and decoration.

Likewise to hard chrome plating on steel, nickel plating on carbon and mild steel does not differ much from other metals. Rather than use electricity, we submerge the steel in an aqueous solution that utilizes chemical agents to reduce the nickel ions and facilitate deposition. The process is highly stable and produces an even nickel coating.
